In this test there were:
- one tester with extensive experience in GNOME
- one Linux user, but not GNOME one
- three people without any Linux experience

The heat map:

Gedit					
Type & save file	G	G	G	G	G
Replace	G	Y	G	G	Y
Font change	G	B	Y	O	R
Files					
File search	G	G	G	G	G
Bigger text	G	B	R	B	B

After each test I asked the tester to name one most confusing thing in their test experience. Now that I got 5 points of confusion, I made a second pass showing each tester the full list and asking them to check if they agree. That's what I got:

- There are 2 menus: hamburger (3-dash) menu and "application menu" (left top) – **5** "black stars".
- About that 2 menus too: they sometimes have common elements, sometimes not – **5**
- In GNOME Files: common zoom shortcuts [ctrl +], [ctrl -], and [ctrl mouse-wheel] work on icon size, but don't work on text size – **4**
- GNOME Files: one have to get out of app to change the font size, the font changes system-wide – **4**
- In addition to latter one – one even need to install another app (Tweaks) to do the thing – **3**

So there is pretty much a consensus about black usability spots in this test.
